

Consideration	New Location		
	No	Unclear	Yes
Is the site far enough from town so that odors or smoke are not a problem?			
Have you studied the dominant wind direction, and does it blow away from, or bypass, the Village the large majority of time?			
Is the site far enough from any future development that might take place?			
Is the site far enough from an airport (Federal regulations state it must be at least 5,000 ft, and 10,000 ft for a jet runway)			
Is the site far enough from the water intake and traditional drinking water sources?			
Is the site <i>downwind</i> of the water intake, traditional water sources, and berry grounds - to avoid unsafe smoke and ash settlement?			
Does the land need to be used for anything else (if so, could both projects work there)?			
Does the location make sense in terms of convenience and traffic for the most people possible? You want to limit activity in the area, but you want the burnbox to be used if you have self-haul.			
Would the location affect migration patterns of wildlife (e.g. caribou)?			
Would the community feel they needed to change subsistence practices, regardless of physical contamination potential?			
Is the location <i>downstream</i> of important fishing, berry gathering/hunting grounds as much as possible?			
Does the community support the new location?			
Will construction or activity at the site or along the access road affect wildlife or important land?			
Has the old location been considered? The land is already impacted (and probably contaminated), and an access way already exists.
